Block Diagram of AT89C5131

RAM Memory and accessibility

8051 Registers

- Register A,B,R0,R1.....R7 are of 8 bits.
- DPTR and PC are of 16 bits.
 - DPTR : Dual Data Pointer Register
 - PC : Program Counter

Program Status Word (PSW)

Flag Bits

CY	AC	F0	RS1	RS0	OV	----	P
-----------	-----------	-----------	------------	------------	-----------	-------------	----------

- CY** : Carry Flag
- AC** : Auxiliary carry
- F0** : User definable(Not Utilized here)
- RS1** : Register Bank Selector bit 1
- RS0** : Register Bank selector Bit 0
- OV** : Overflow Flag The result of signed number operation is too large, causing the high-order bit to overflow into the sign bit
- P** : Parity Flag Reflect the number of 1s in Accumulator (Odd parity)

Addressing Modes

- **MOV DESTINATION, SOURCE**

Immediate:

- MOV A , #55H ; Loading 55h in accumulator
- MOV R1, #37 ; Loading 37 in register R1

Direct Addressing:

- MOV A , 55H ; Loading content of memory location 55h in A
- MOV R1, 37 ; Loading content of memory location 37d in R1
- MOV 35H, R2 ; Copying content of R2 in location 35h

Addressing Modes

Register Addressing:

- `MOV R3, R7` ; Copying content of register R7 into R3
- `ADD A, R1` ; Adding the contents of A and R1

Indirect Addressing:

- Only register R0, R1 can be used
- Identified by @ symbol
- `MOV A,@R0` ;move contents of RAM whose address is held by R0 into A

Problem Statement

Write an assembly language program

- To find the sum of N numbers starting from 1 and stores the partial sum values in N consecutive memory locations.
- $N < 20$ and is given in memory location 50H.
- The resultant sum is to be stored in memory locations starting at 51H.
- As an example, if 3H is in 50H. Your program should result in having 1, 3, and 6 in memory locations 51H, 52H, and 53H.

Logic

By adding No. and Previous Partial Sum

No.	1	2	3	4	5	6
Partial Sum	1	3	6	10	15	21
Previous Partial Sum	-	1	3	6	10	15
Partial Sum Store Location	51H	52H	53H	54H	55H	56H

Things To Do

Decide No of Register required. (R0 ,R1, R2,,R7)

- One for storing no. and One for the value of N.
- One as Memory Pointer
- Accumulator needed as arithmetic operation will be performed

Identify Memory location to be Used:

- From where to read input and store the result.

Time Taken By Instructions

- One Machine Cycle takes 0.5us.

Instruction	No. of Machine Cycle	Time
INC A	1	0.5us
DJNZ R, Rel	2	1us
MUL AB	4	2us
